

# Comparison tables: BBOB 2015 function testbed with BBOB 2009 as reference

The BBOBies

July 16, 2015

## Abstract

This document provides tabular results of the workshop on Black-Box Optimization Benchmarking held at GECCO 2015, see <http://coco.gforge.inria.fr/doku.php?id=bbob-2015>. Overall, 18 algorithms have been tested on 24 benchmark functions in dimensions between 2 and 20. Only three of them have been tested on the optional instances in dimension 40. A description of the used objective functions can be found in [7, 5]. The experimental set-up is described in [6].

The performance measure provided in the following tables is the expected number of objective function evaluations to reach a given target function value (ERT, expected running time), divided by the respective value for the best algorithm in BBOB-2009 (see [2]) if an algorithm from BBOB-2009 reached the given target function value. The ERT value is given otherwise ( $\text{ERT}_{\text{best}}$  is noted as infinite). See [6] for details on how ERT is obtained. Bold entries in the table correspond to values below 3 or the top-three best values. Table 1 gives an overview on all algorithms submitted to the noise-free testbed at GECCO 2015.

Table 1: Names and references of all algorithms submitted for the noise-free testbed

algorithm name	short	paper	reference
BSifeg		Dimension Selection in Axis-Parallel Brent-STEP Method for Black-Box Optimization of Separable Continuous Functions	[9]
